

KPI Reporting Automation - Project Synopsis

Project Overview:

KPI Reporting Automation is a data analytics project developed to automate the generation of Key Performance Indicator (KPI) reports using Python, Pandas, Excel automation and Streamlit.

Objective:

The objective of this project is to process operational KPI data, generate automated reports, and provide an interactive dashboard for monitoring business performance metrics.

Tools and Technologies:

- Python
- Pandas
- OpenPyXL
- Streamlit
- Excel Reporting

Project Workflow:

1. Raw KPI data is collected from CSV files.
2. Data is processed and analyzed using Python and Pandas.
3. KPI calculations and reporting logic are automated.
4. The generated KPI report is saved as an Excel file.
5. A Streamlit dashboard displays the generated KPI report and key metrics.

Key Features:

- Automated KPI report generation
- Excel report creation
- Interactive dashboard visualization
- KPI summary metrics
- Data-driven performance monitoring

Business Use Case:

Organizations can use this solution to reduce manual reporting effort, improve reporting accuracy, and provide faster visibility into operational performance.

Project Outcome:

Successfully created an automated KPI reporting system with a Streamlit dashboard that converts raw KPI data into meaningful business insights.
